particles in magnetic field*

Mayuri S. Puri

WHAT IS DIRAC DELTA FUNCTION:

It is introduced by Paul Dirac.

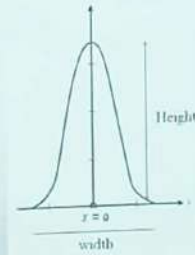

It is a generalized function or distribution over real numbers, whose value is at one point and zero everywhere.

Integral over the entire real line is equal to unity.

$$\delta(x - a) = \begin{cases} \infty & x = a \\ 0 & x \neq a \end{cases}$$

Area under this curve is always unity.

$$\int_{-\infty}^{+\infty} \delta(x - a) dx = 1 \quad (x = a)$$

Krishna Wildlife Sanctuary

• Introduction :

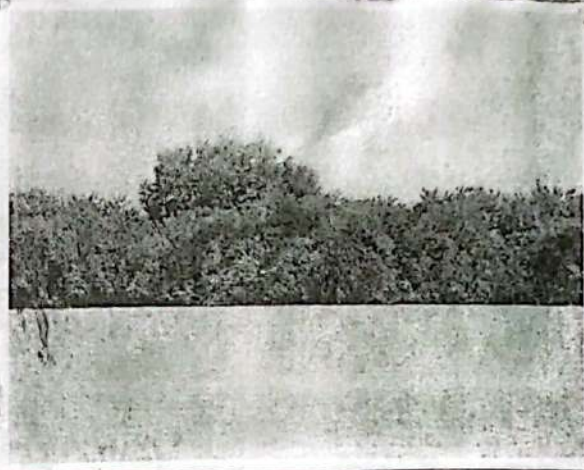

Krishna Wildlife Sanctuary is a wildlife sanctuary and estuary located in Andhra Pradesh, India. It is one of the best eco-regions of the world owing to the fact that it harbors vast tracts of pristine mangrove forests. It is believed among conservationists as one of the last remaining tracts of the thick primary mangrove forests of South India, which is rapidly disappearing due to absence of protective measures.

The sanctuary is a part of the mangrove wetland in Andhra Pradesh and are located in the coastal plain of Krishna delta, spread across Krishna and Guntur districts of Andhra Pradesh.

It includes Sorlagondi Reserve forest, Nachugunta Reserve forest, Yelichetladibba Reserve forest, Kottapalem Reserve forest, Molagunta Reserve forest, Adavuladivi Reserve forest, and Lankivanidibba Reserve forest. They occupy the islands of the delta and the adjacent mainlands of Krishna and Guntur Districts.

A part of the mangroves is located far from the main mangrove area. This unconn

Varadachari Shilpika Madhavi
ected regions lies near Machilipatnam on its
side eastern side and Nakshatranayar on its
western side.

The estuary of Krishna River
River passes through the sanctuary, and the
mangroves line the estuary. It is believed that
this region potentially holds one of the most
significant populations of fishing cats in the
world and yet, no concrete surveys on fishing
cats or community-based fishing cat conse-
rvation efforts have been carried out here.
The area has the potential to become
world's first reserve for a few of the IUCN
identified endangered species including the
fishing cat or better known locally as
bavuru pilli.

Ans :- Herdmania :-

- Ascidian or Herdmania is exclusively marine animal and worldwide in distribution.
- It belongs to the phylum Chordata and sub-phylum Urochordata or Tunicata.
- Urochordates include those forms that are commonly called 'sea squirts' or 'sea potatoes'.
- The term Urochordates include those forms means that the notochord is seen in the tail region. These are sedentary adults that do not show any resemblances to chordates, but their free swimming larval forms.
- Show chordate features such as the presence of a notochord that is seen only in tail.

Recombination of Bacteria. ***

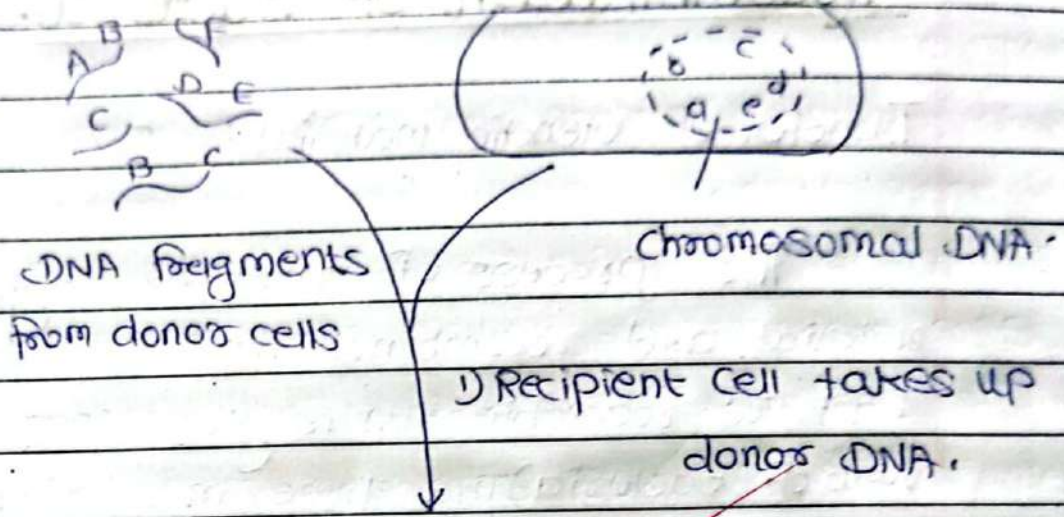

Transfer of Genetic material in Bacteria

The process of transfer of genetic material and recombination is very interesting. bacterial recombination is given. (PPT an over view of bacteria) The three main mechanism by which bacteria acquire new DNA are transformation, conjugation, and transduction. Transformation involves acquisition of DNA from the environment, conjugation involves acquisition of DNA directly from another bacterium and transduction involves acquisition of bacterial DNA via a bacteriophage intermediate.

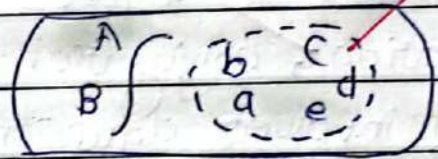

Transformation :-

Transformation is the process by which bacteria pick up DNA from their environment. the DNA may come from a variety of sources, but most likely it is the remnants of DNA from dead bacterial cells.

Recipient Cell

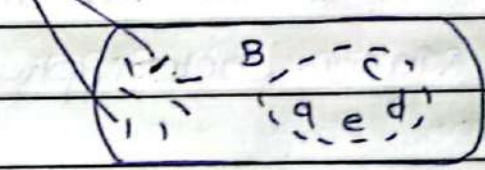

1) Recipient cell takes up donor DNA.

Degraded unrecombined DNA

2) Recombination occurs between donor DNA and recipient DNA.

Genetically transformed cell.

In order to become successfully transformed bacteria must be competent. This means that the bacteria are expressing to appropriate enzymes required to transport the exogenous DNA into the cell. Therefore, the correct genes must be expressed in order to carry out transformation. Expression of these genes depends on the growth condition. Bacteria most likely to be competent are dividing rapidly, but nutrients in the environments are becoming limited.

In transformation, a cell surface receptor binds to DNA in the environment. After binding, the DNA is transported across the membrane by the exonuclease, so that the DNA that enters the cell is single stranded. This promotes recombination to, as long as the DNA taken up is sufficiently homologous to the host DNA to allow recombination to occur. The recombination that occurs is one-way; unlike the exchange of strands diagrammed in the module on recombination, in this case the new DNA will simply replace a strand of a different

Conjugation Involving Hfr Bacteria

occasionally, the F Factor integrates into a random position in the bacterial chromosome. when this happens, the bacterial cell is called Hfr instead of F⁺. Hfr bacteria are still able to initiate conjugation of with F⁻ cells, but the outcomes is completely different from conjugation involving F⁺ bacteria.

As mentioned above Hfr cells are formed when the F Factor integrates into the bacterial chromosome. the integration occurs at a random location.

the Hfr cell is still able to initiate conjugation with an F⁻ cell

when DNA transfer begins, the Hfr cell transfers the entire bacterial chromosome to the F⁻ cell. the first DNA to be transferred is chromosomal DNA, and the last DNA to be transferred will be F-Factor DNA.

Write a brief on Herdmania including systematic position, external features and digestive system.

Ans:- Ascidian or Herdmania is exclusively marine animal and worldwide in distribution. It belongs to the phylum chordata and sub phylum urochordata or Tunicata. Urochordates include those forms that are commonly called 'sea squirts' or 'sea potatoes'. The term urochordata means that the notochord is seen in the tail region. These are sedentary adults that do not show any resemblances to chordates, but their free swimming larval forms show chordate features such as the presence of a notochord that is seen only in the tail the solid dorsal nerve cord and pharyngeal gill slits. The notochord and the nerve cord are lost in the adult. The gill slits are retained in that adult but they do not communicate to the exterior but open into a cavity called the atrium. The larval form therefore shows retrogressive metamorphosis. The Ascidian belongs to the

class Ascidiacea as it is covered by a test or tunic. There are two apertures, an anterior branchial aperture and a posterior atrial aperture. They are sedentary or fixed forms.

Systematic position

- phylum - Chordata
- subphylum - Urochordata
- class - Ascidiacea

External features

- shape, size and colouration :
The base is attached to the substratum and is also known as the foot. The size varies from 6 to 12 cms in length and is about 4 to 7 cm wide. The animal is pinkish in colour.
- Division of Body :
The body is covered by a test or tunic and divisible into body proper and foot.

1. Body proper: The distal free part of animal is body proper. It is broader and longer than the basal part or foot. The free end of the animal has two prominent siphons. The siphons face away from each other. The shorter one is the branchial or the incumbent siphon. The opening of which is the mouth or the branchial aperture & is wide. The longer siphon is the atrial siphon or the excurrent siphon and has the cloacal or atrial aperture. The opening is directed upwards. Four lips bind the apertures. water enters the animal through the branchial aperture and leaves through the atrial aperture. when disturbed the animal contracts. and jets of water squirt out through the siphons hence the name 'sea squirt'

2. Foot : The body has a prominent basal foot meant for attachment. The foot is entirely made by the test or tunic. The foot is embedded with sand, pieces of shell spicules, other animals like coelenterates molluscs and even small ascidians.

Host :-

Main host is cotton but also infests other malvaceous plants namely, okra, Hibiscus, Anthracis, Malvastrum etc. and is very common pest of ladyfingers.

Life cycle

* Eggs

Eggs are spherical bluish green, sculptured and less than 0.5 mm in diameter. Eggs are laid singly on most part of cotton plant (flower buds, bolls, peduncles and bracteoles); the favoured region being young shoots.

* Larva

Fully grown larva is about 1.3 - 1.8 cm long stout and spindle shaped. Last two thoracic and all abdominal segments bear two pairs of fleshy tubercles, one of which is dorsal and other lateral. Larva is light brown with grey to green pale along the mid dorsal line with dark spots at the base of tubercles of the segments. Larval tubercles

are less prominent especially in the abdomen

* pupa

pupation is in a boat shaped tough silken cocoon that is dirty, while to brownish in colour pupae are found on plant or on buds and bolls

* Adult

Adult moths are quite distinctively creamish white or peach with central green wedge running from proximal to the distal edge of the forewing. Hind wing is pale whitish.

oviposition takes place in the night, Female deposits 2-3 eggs on leaf beak, flower bud or tender leaf, usually on the under surface. Fecundity is 200-400 eggs per female. Eggs are deep sky blue or greenish crowned and sculpted on the surface. Incubation period is 3-5 days full.

larva is about 2.0 cm long, brownish with white patches on the dorsal side of the body. There are 6 larval instars and the total larval development takes 12-18 days. pupation takes place on the plant or rarely in the soil among fallen leaves. A boat-shaped greyish silken cocoon is constructed for pupal formation. pupal period is 7-10 days. The total life cycle ranges from 20-22 days. bhendi crop provides effective means of carry over from one to the next season.
